

Antipodean wandering albatross: satellite tracking and population study
Antipodes Island 2020

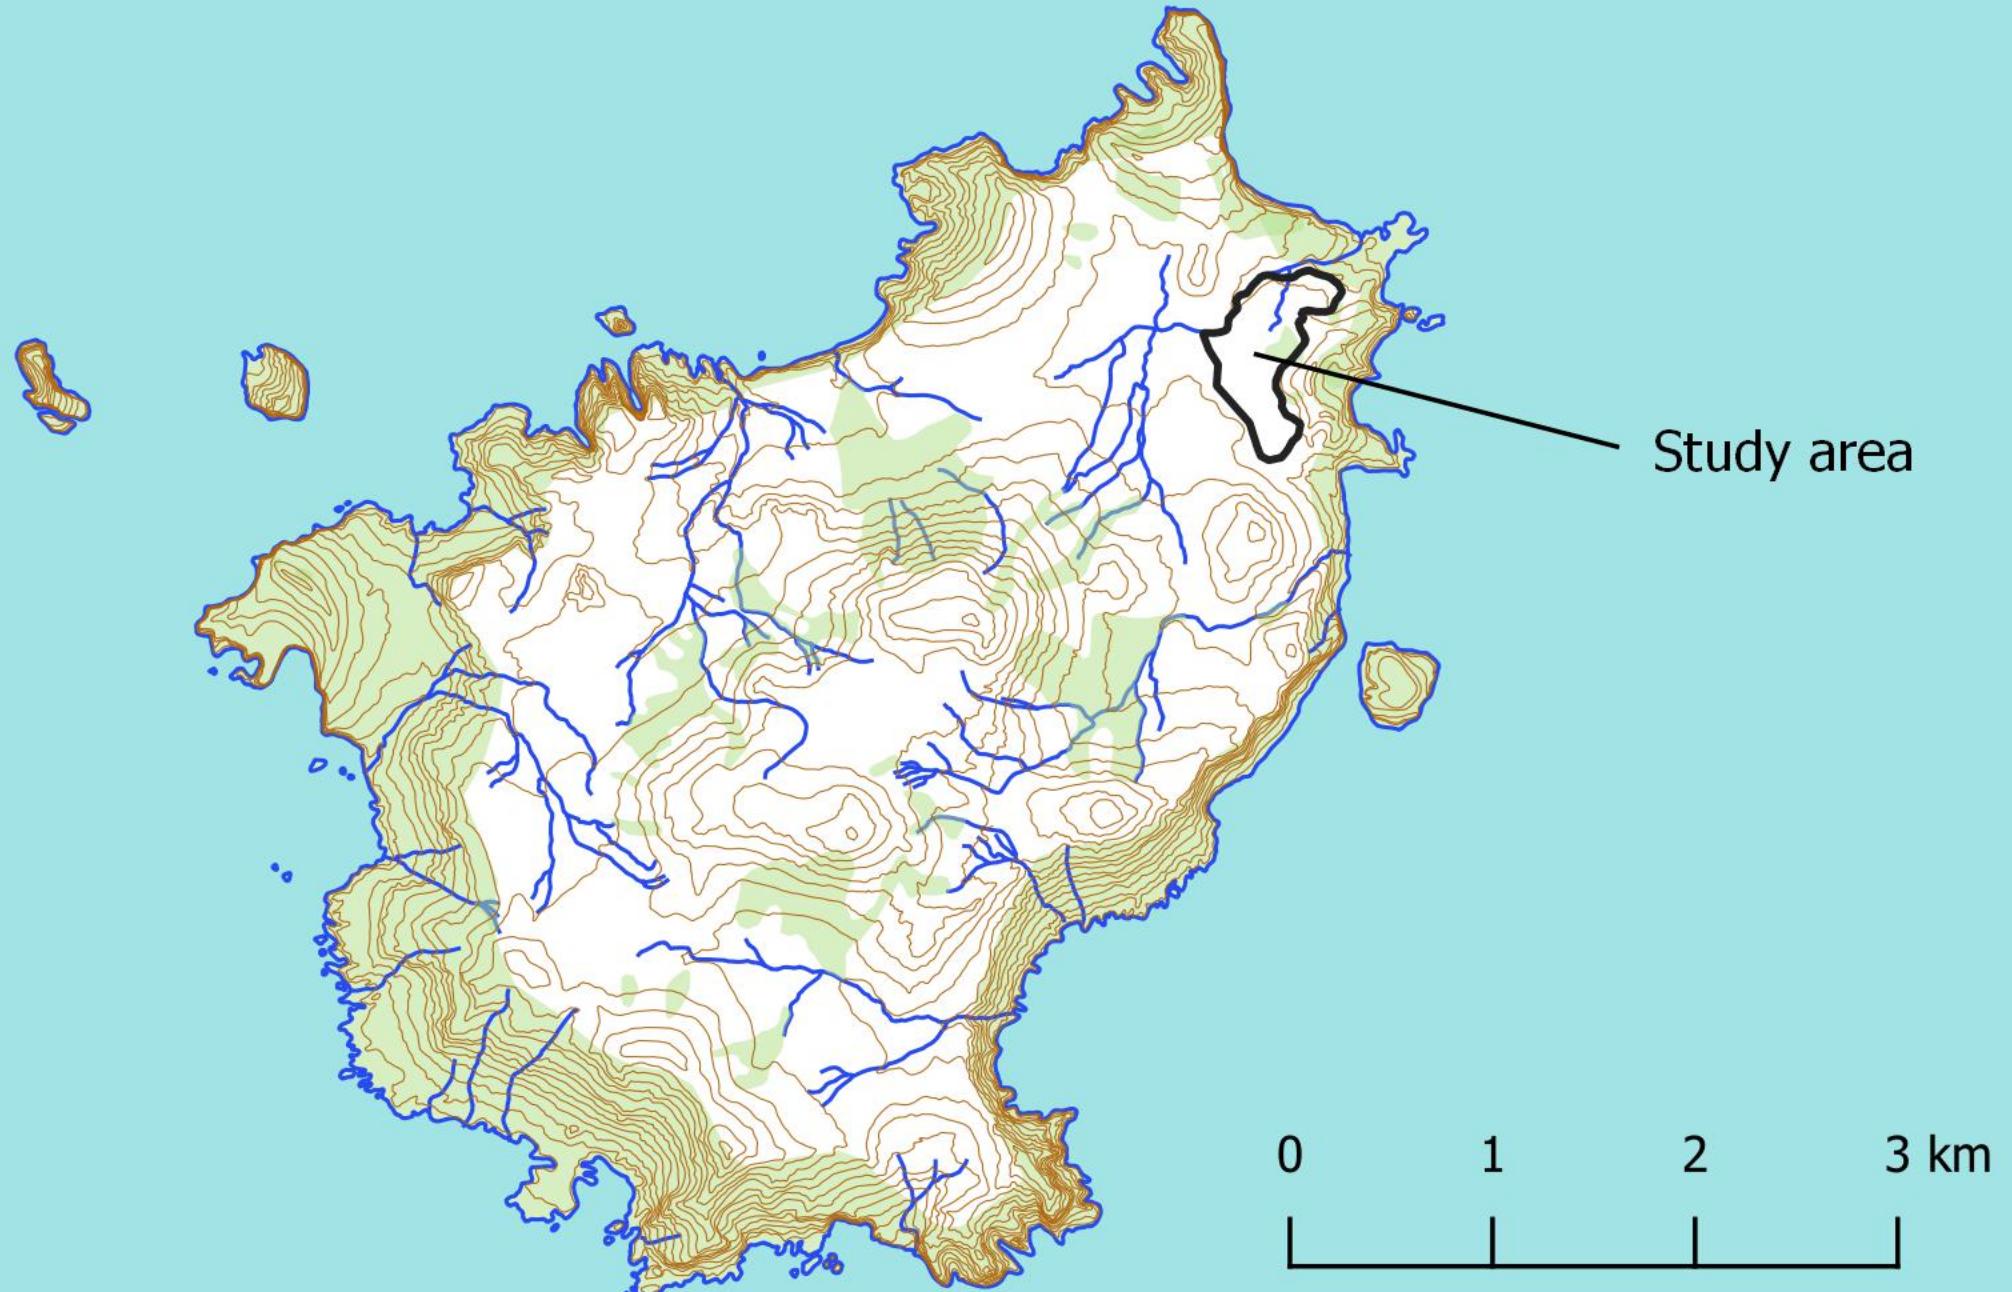

Kath Walker
Graeme Elliott

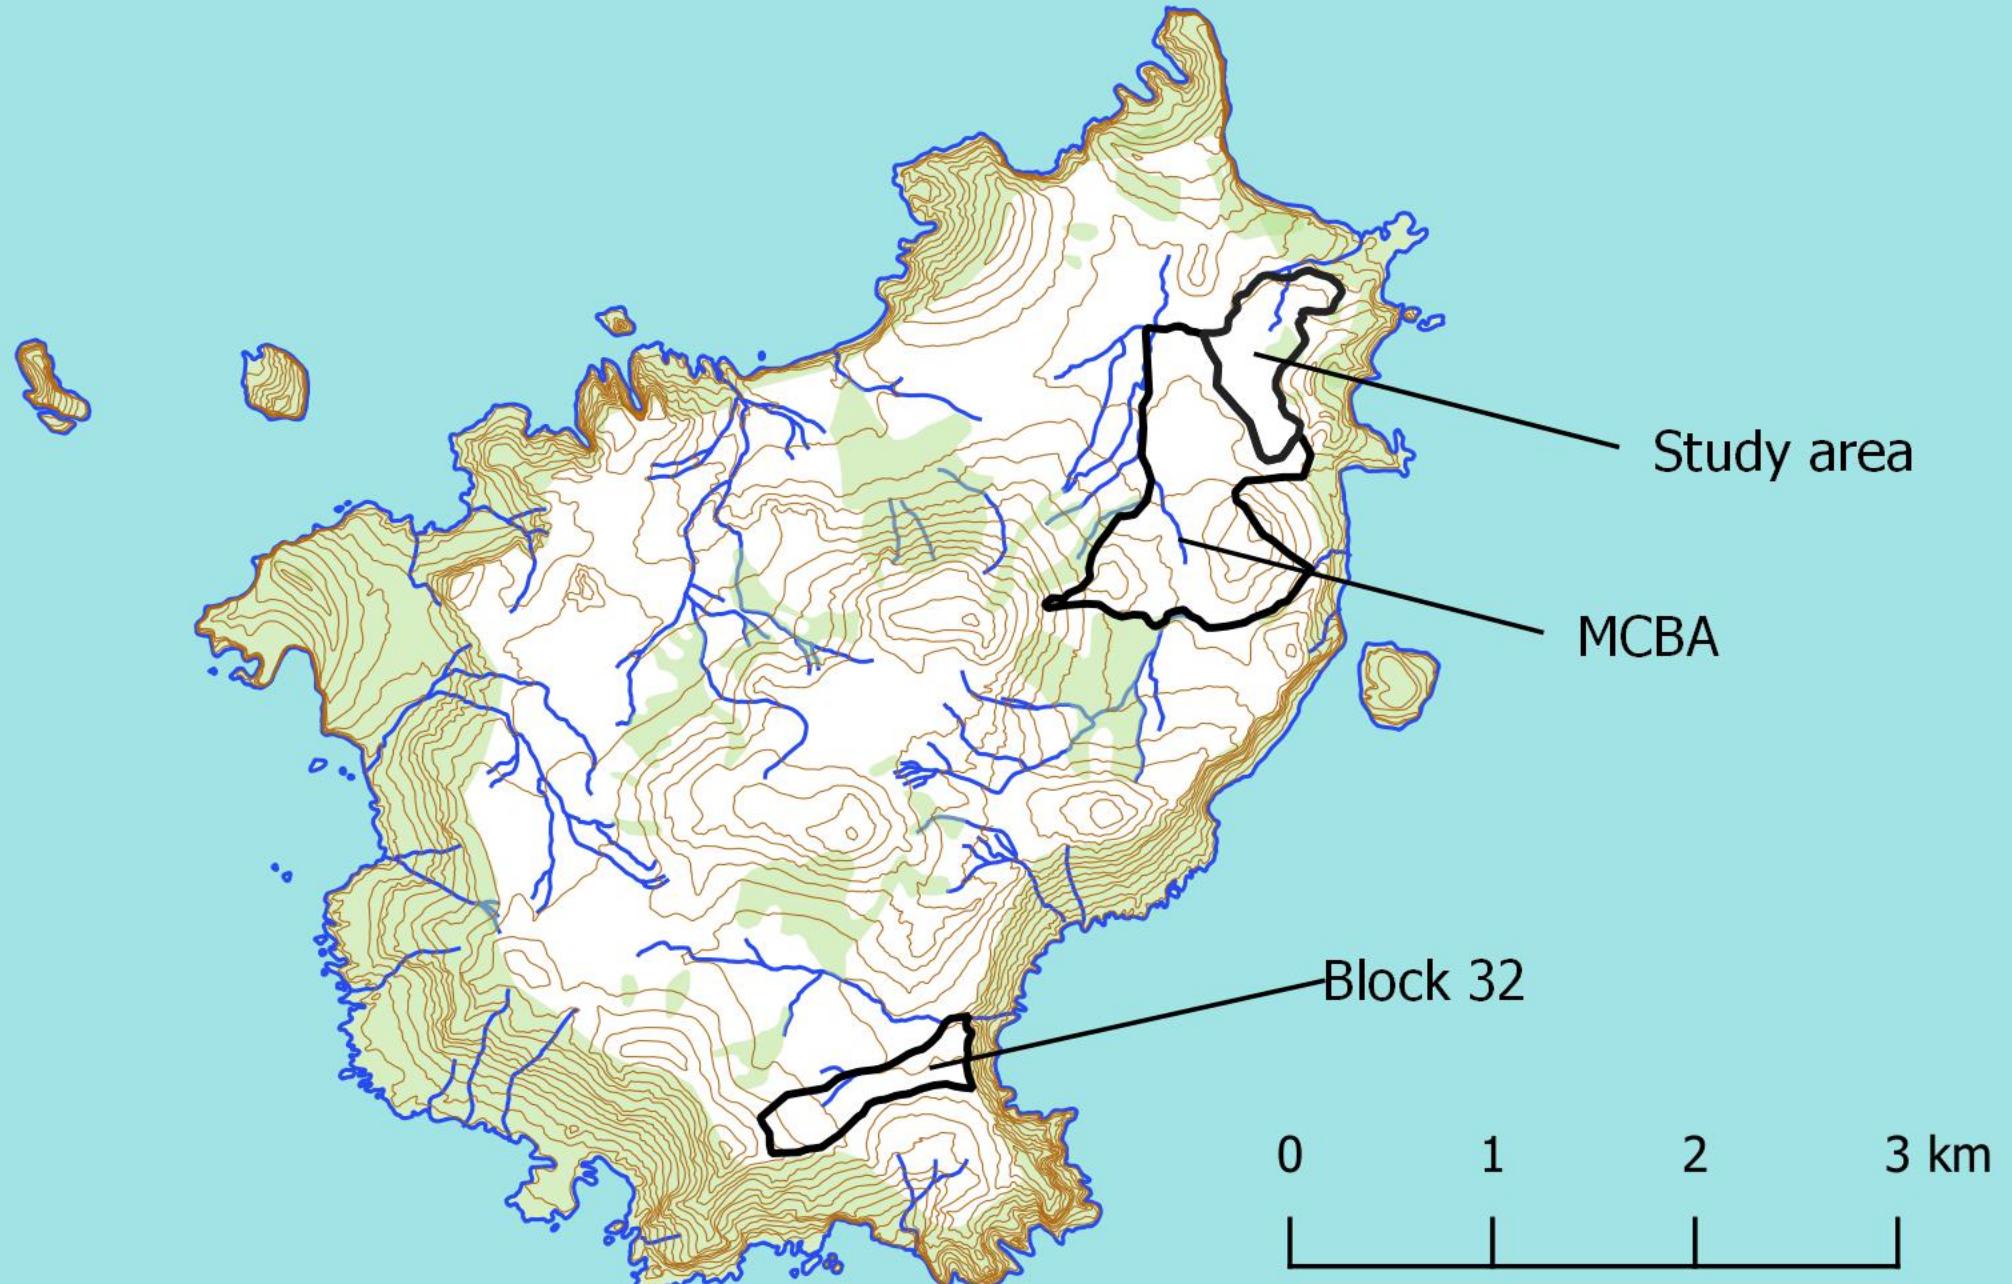

June 2020

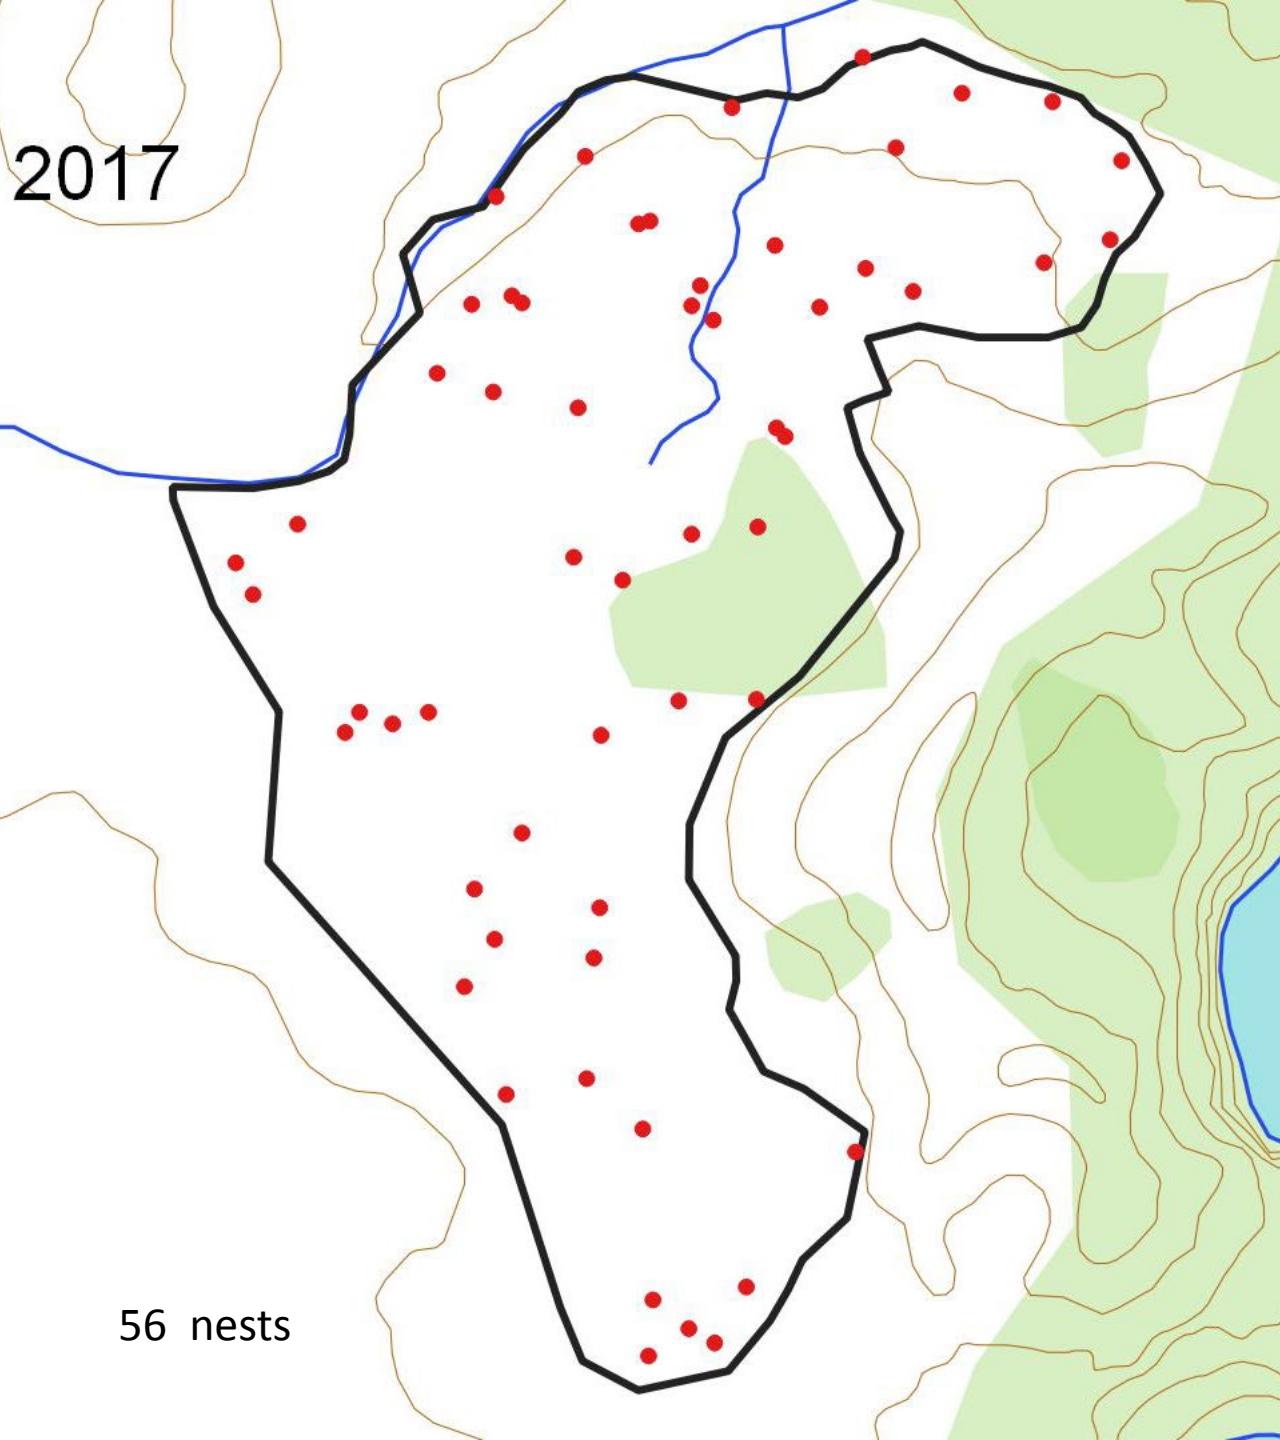

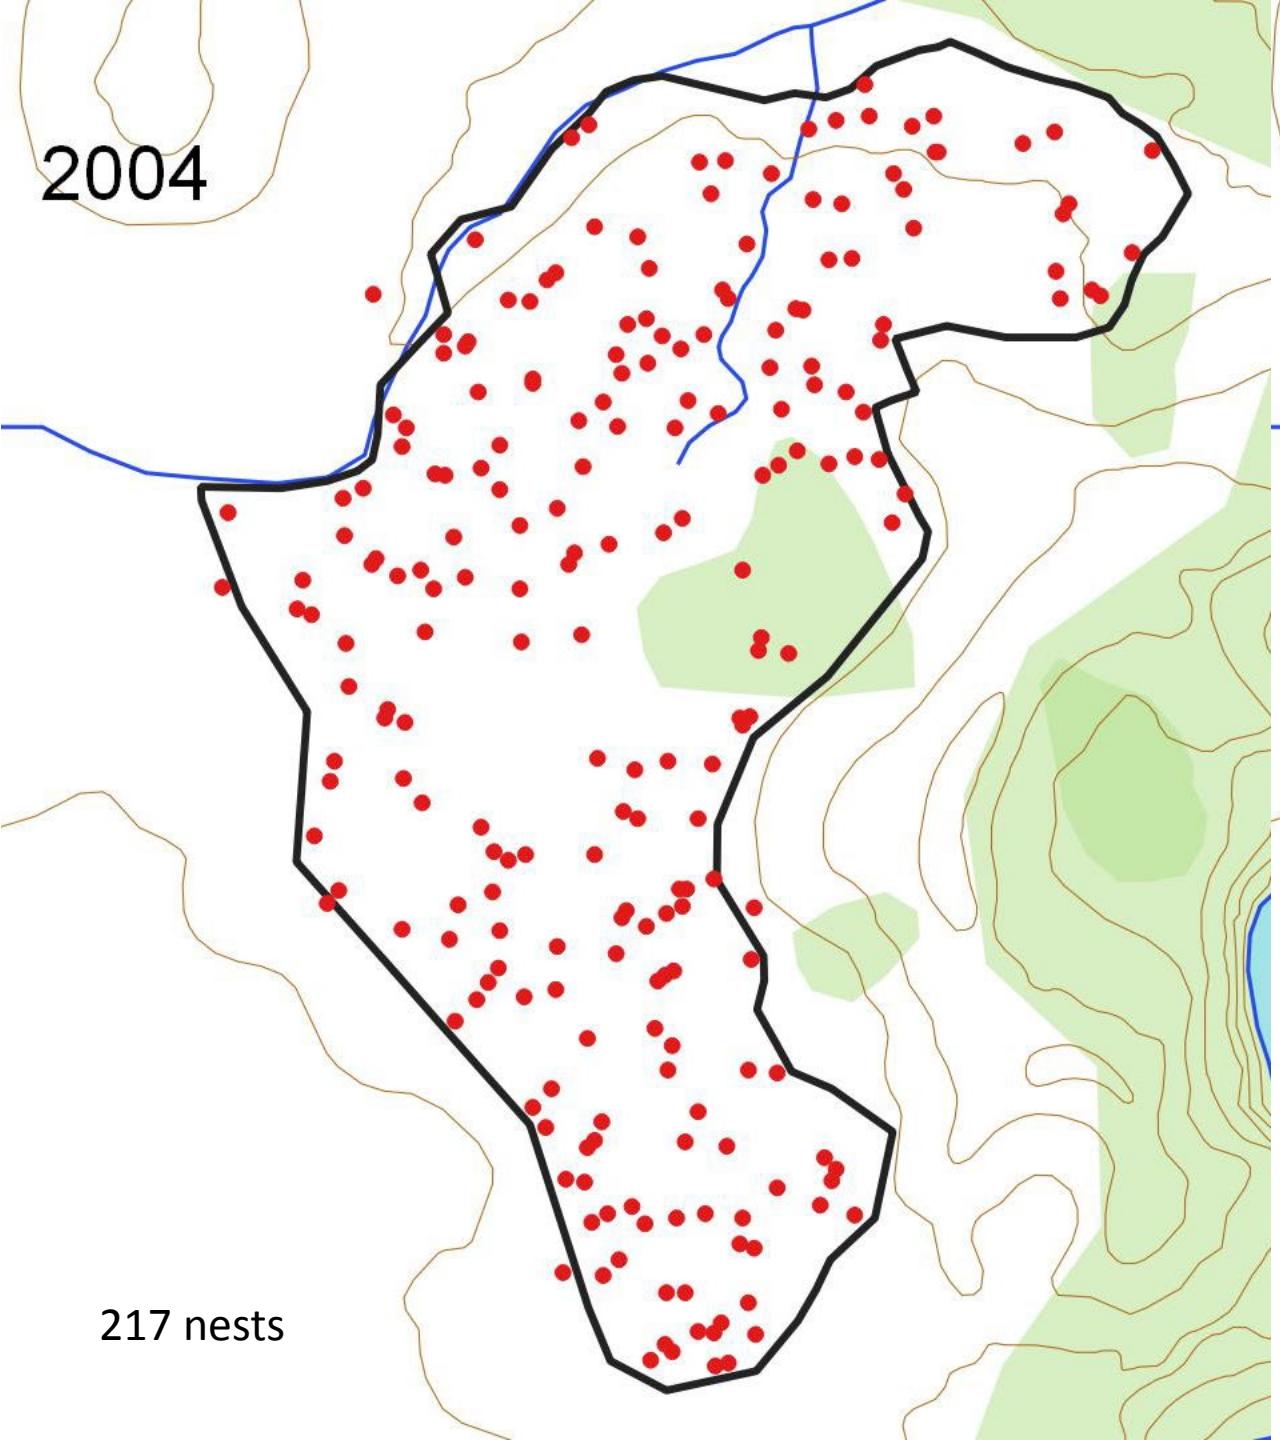

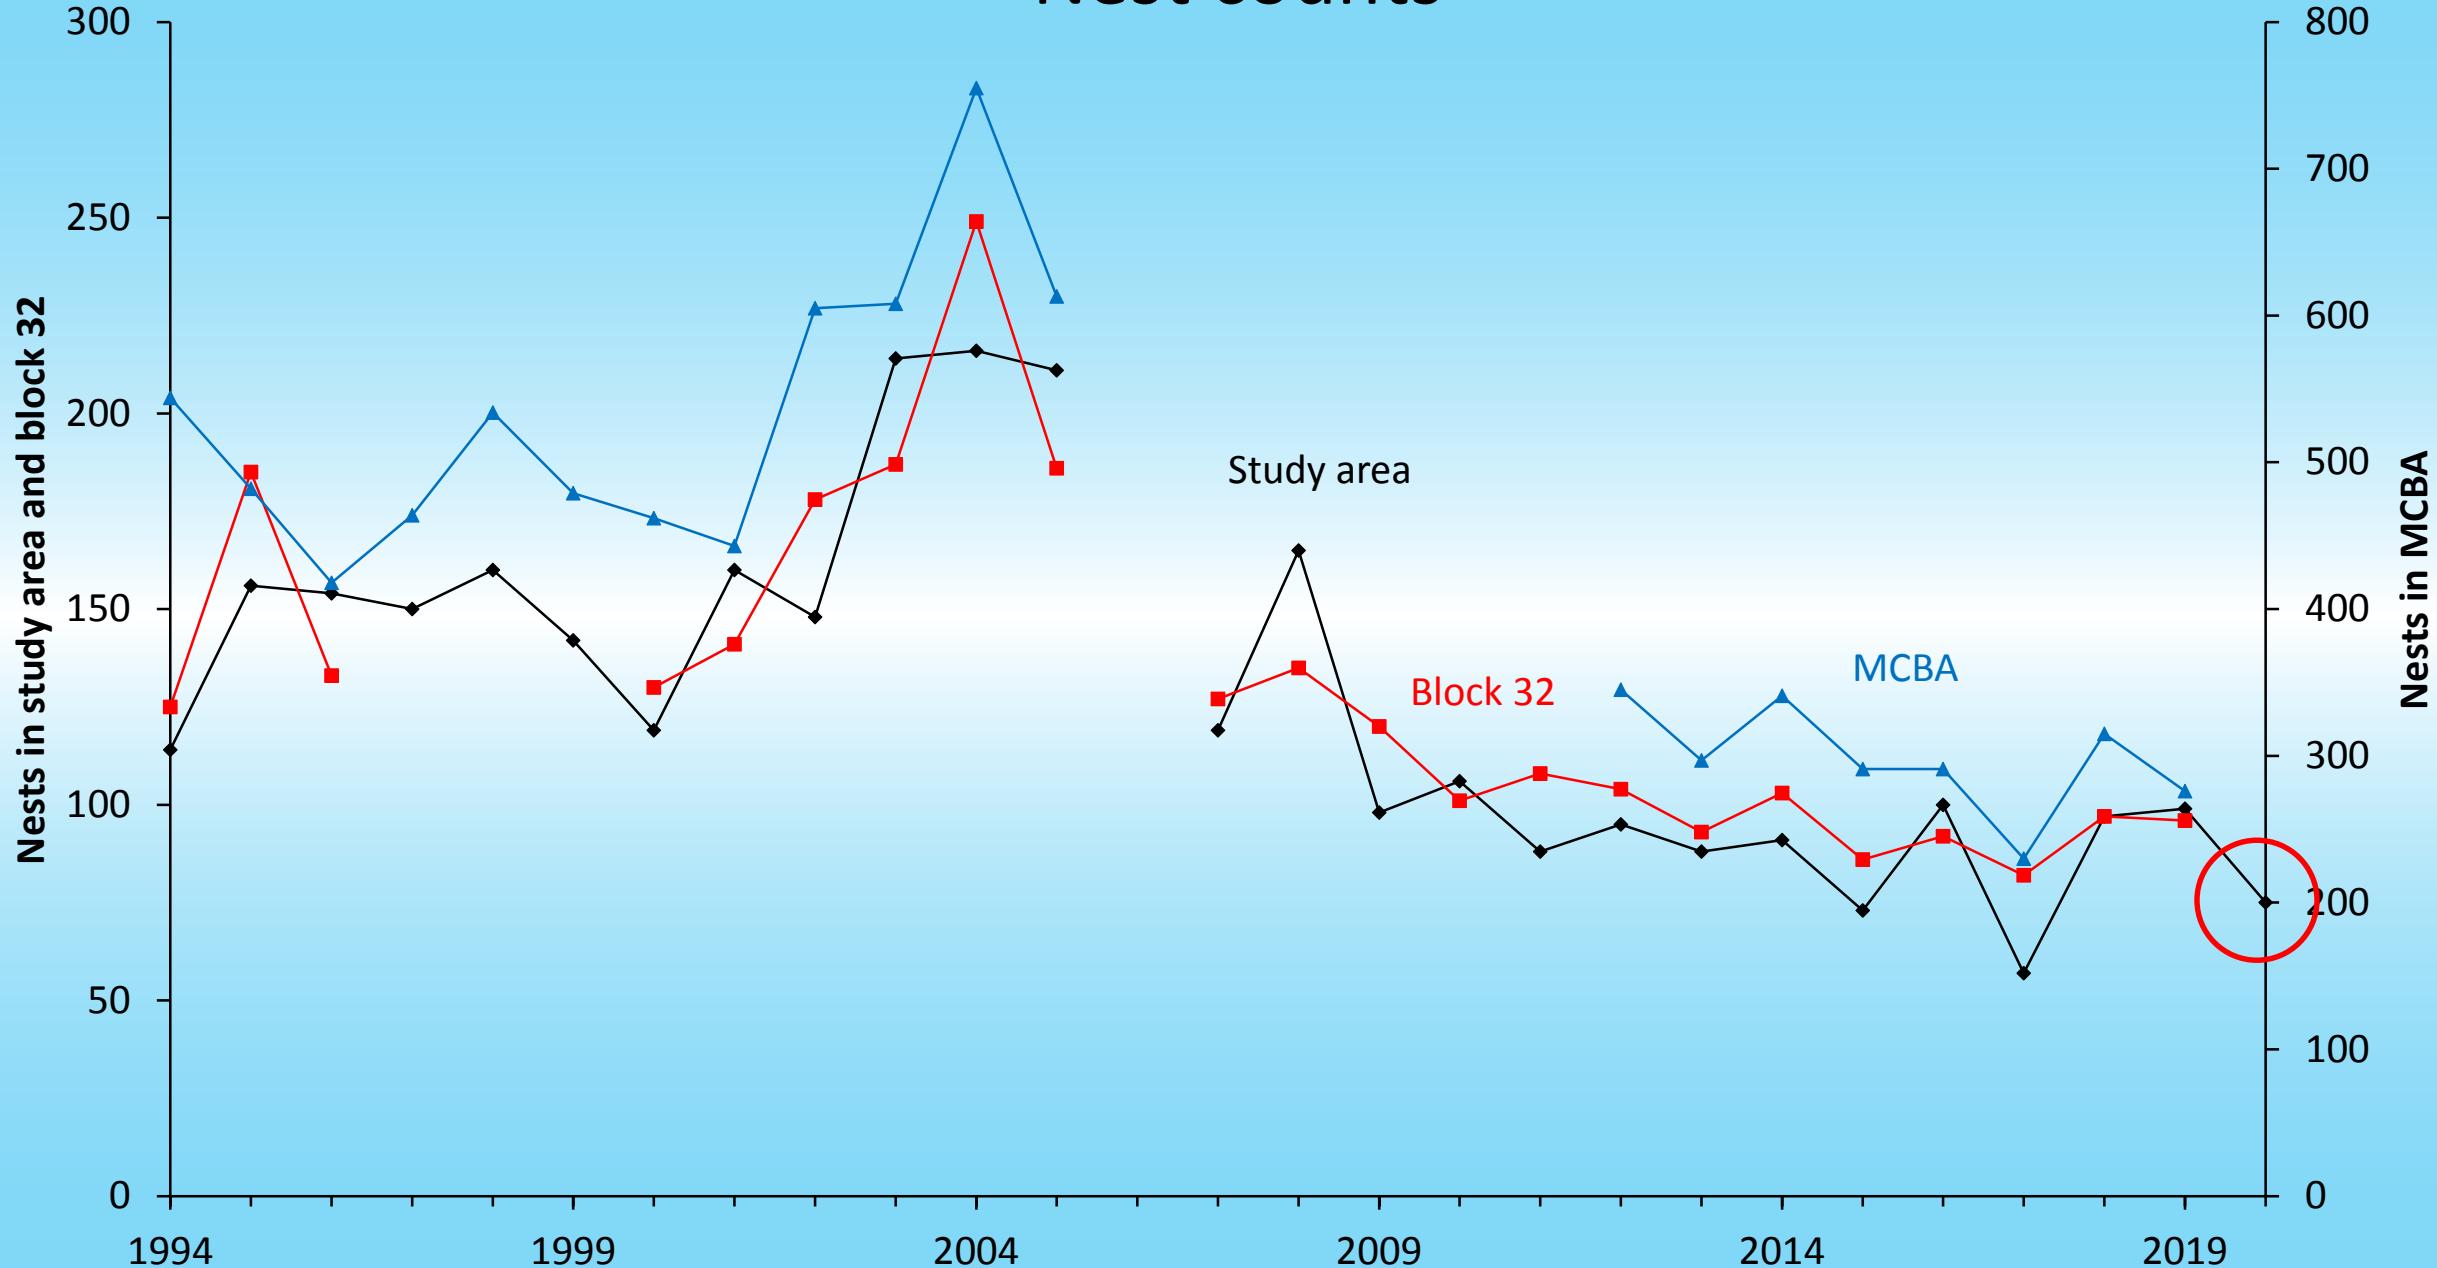

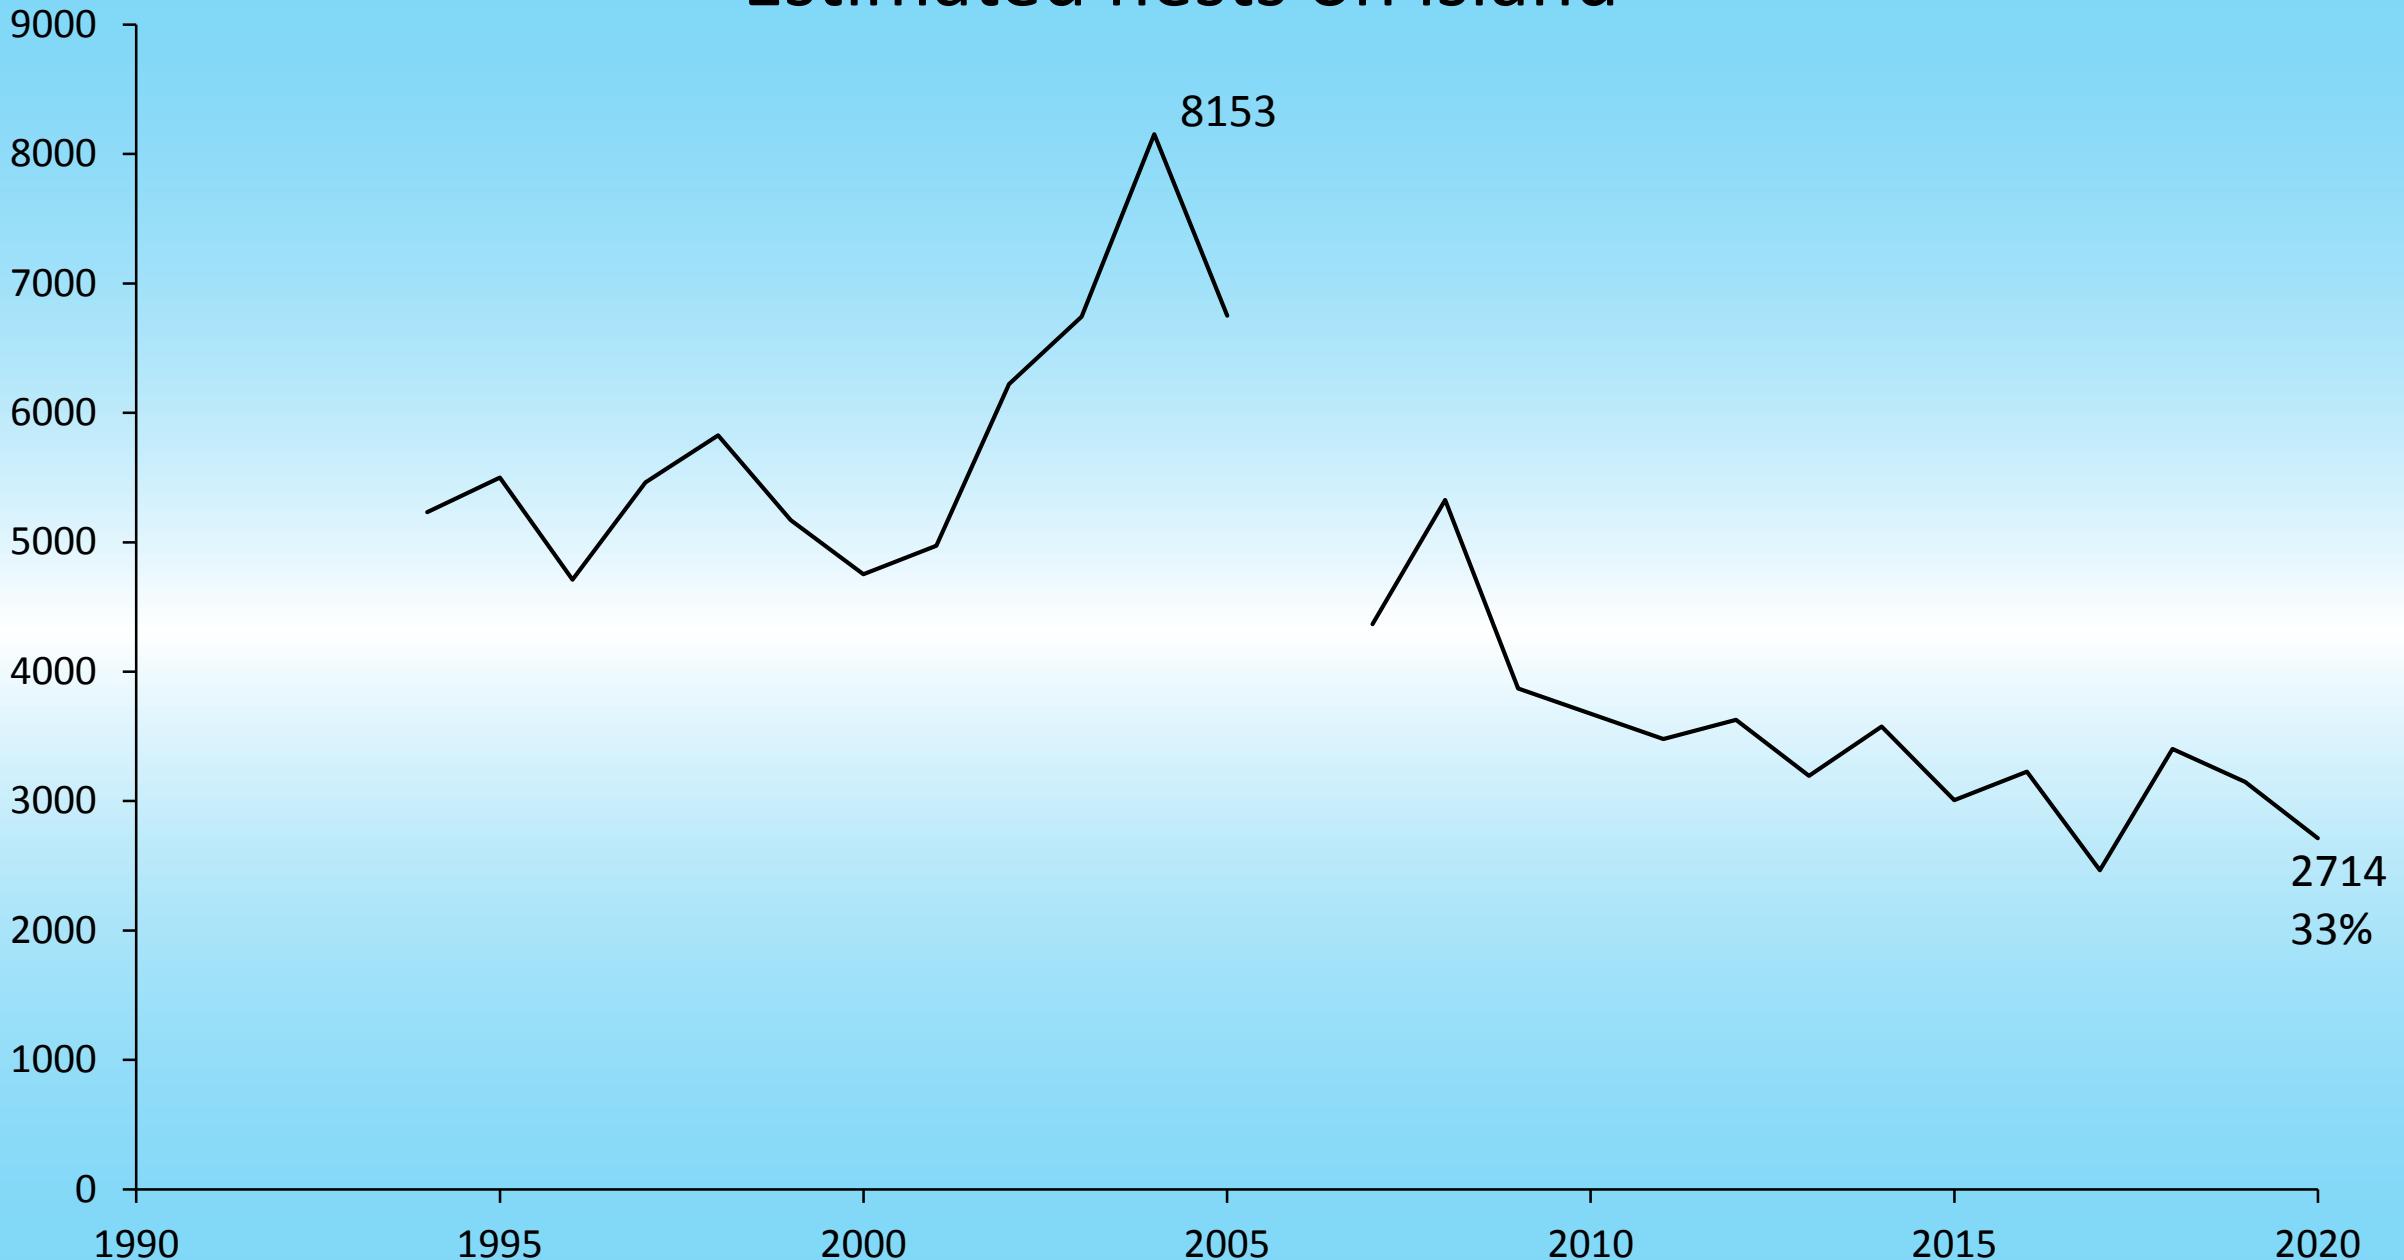

Short late trip

- We weren't able to band the chicks nor put sat tags on them.
- Assessed last year's nesting success – but a bit rough.
- Counted only the nests in the study area – not the other census blocks.
- Found, marked and mapped this year's nests – but might have missed a few that failed early.
- We recorded all the bands we saw – but missed some.
- Banded any nesting birds new to the study area – but missed a few.
- Recruitment estimate - rough.
- 40 satellite tags on adults.

Estimated nests on island

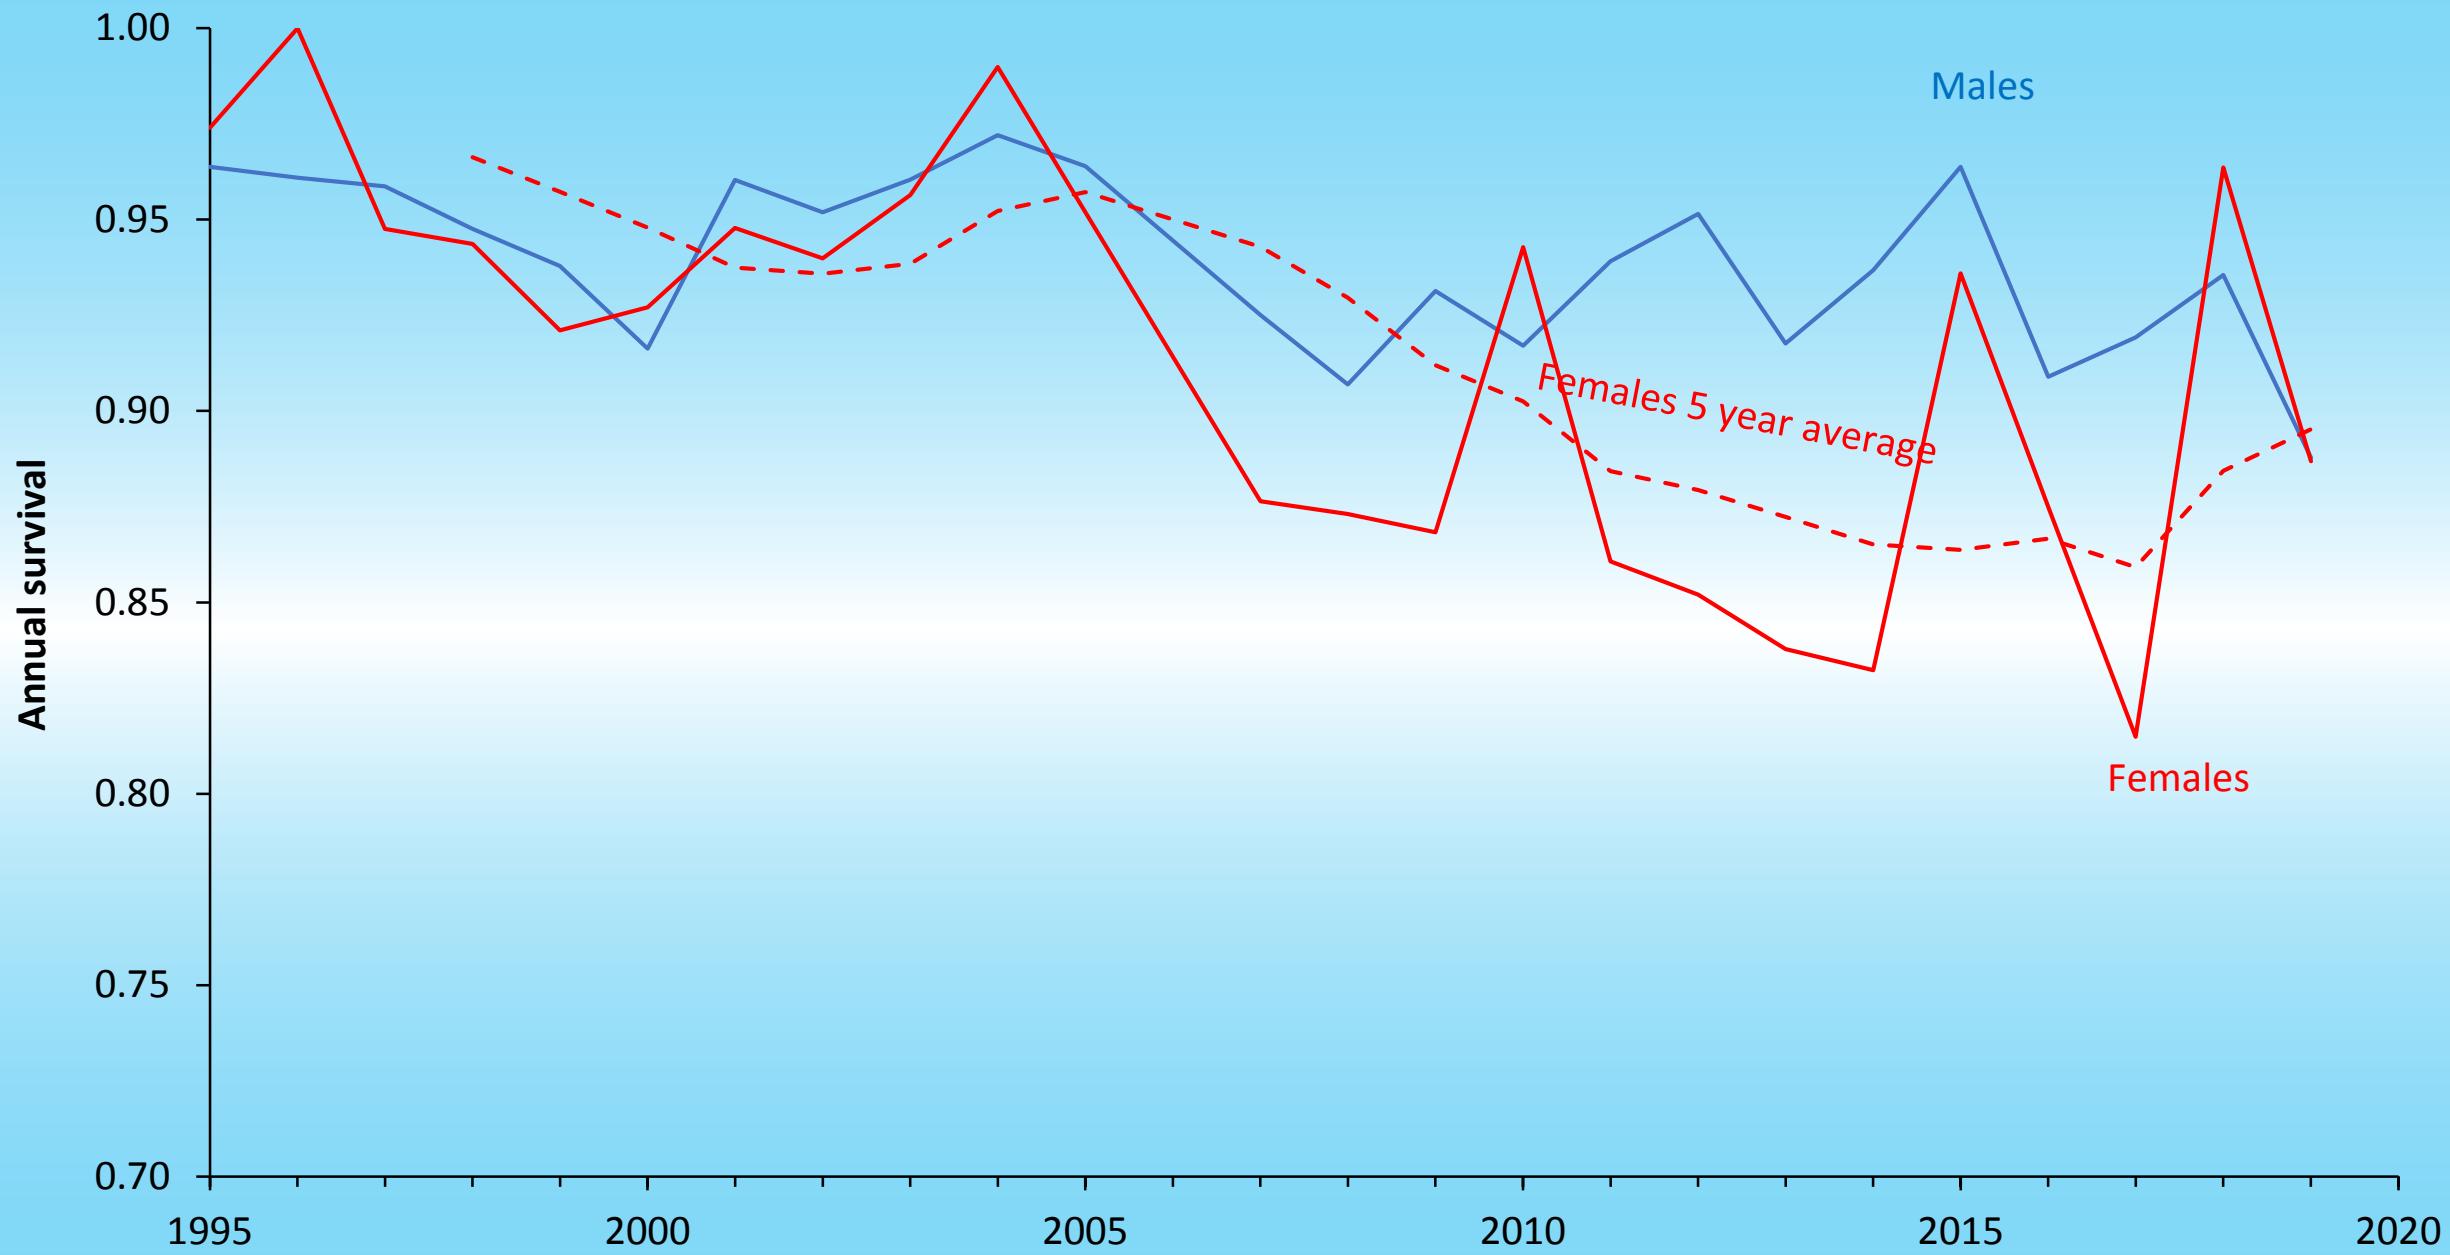

Mark-recapture population estimates

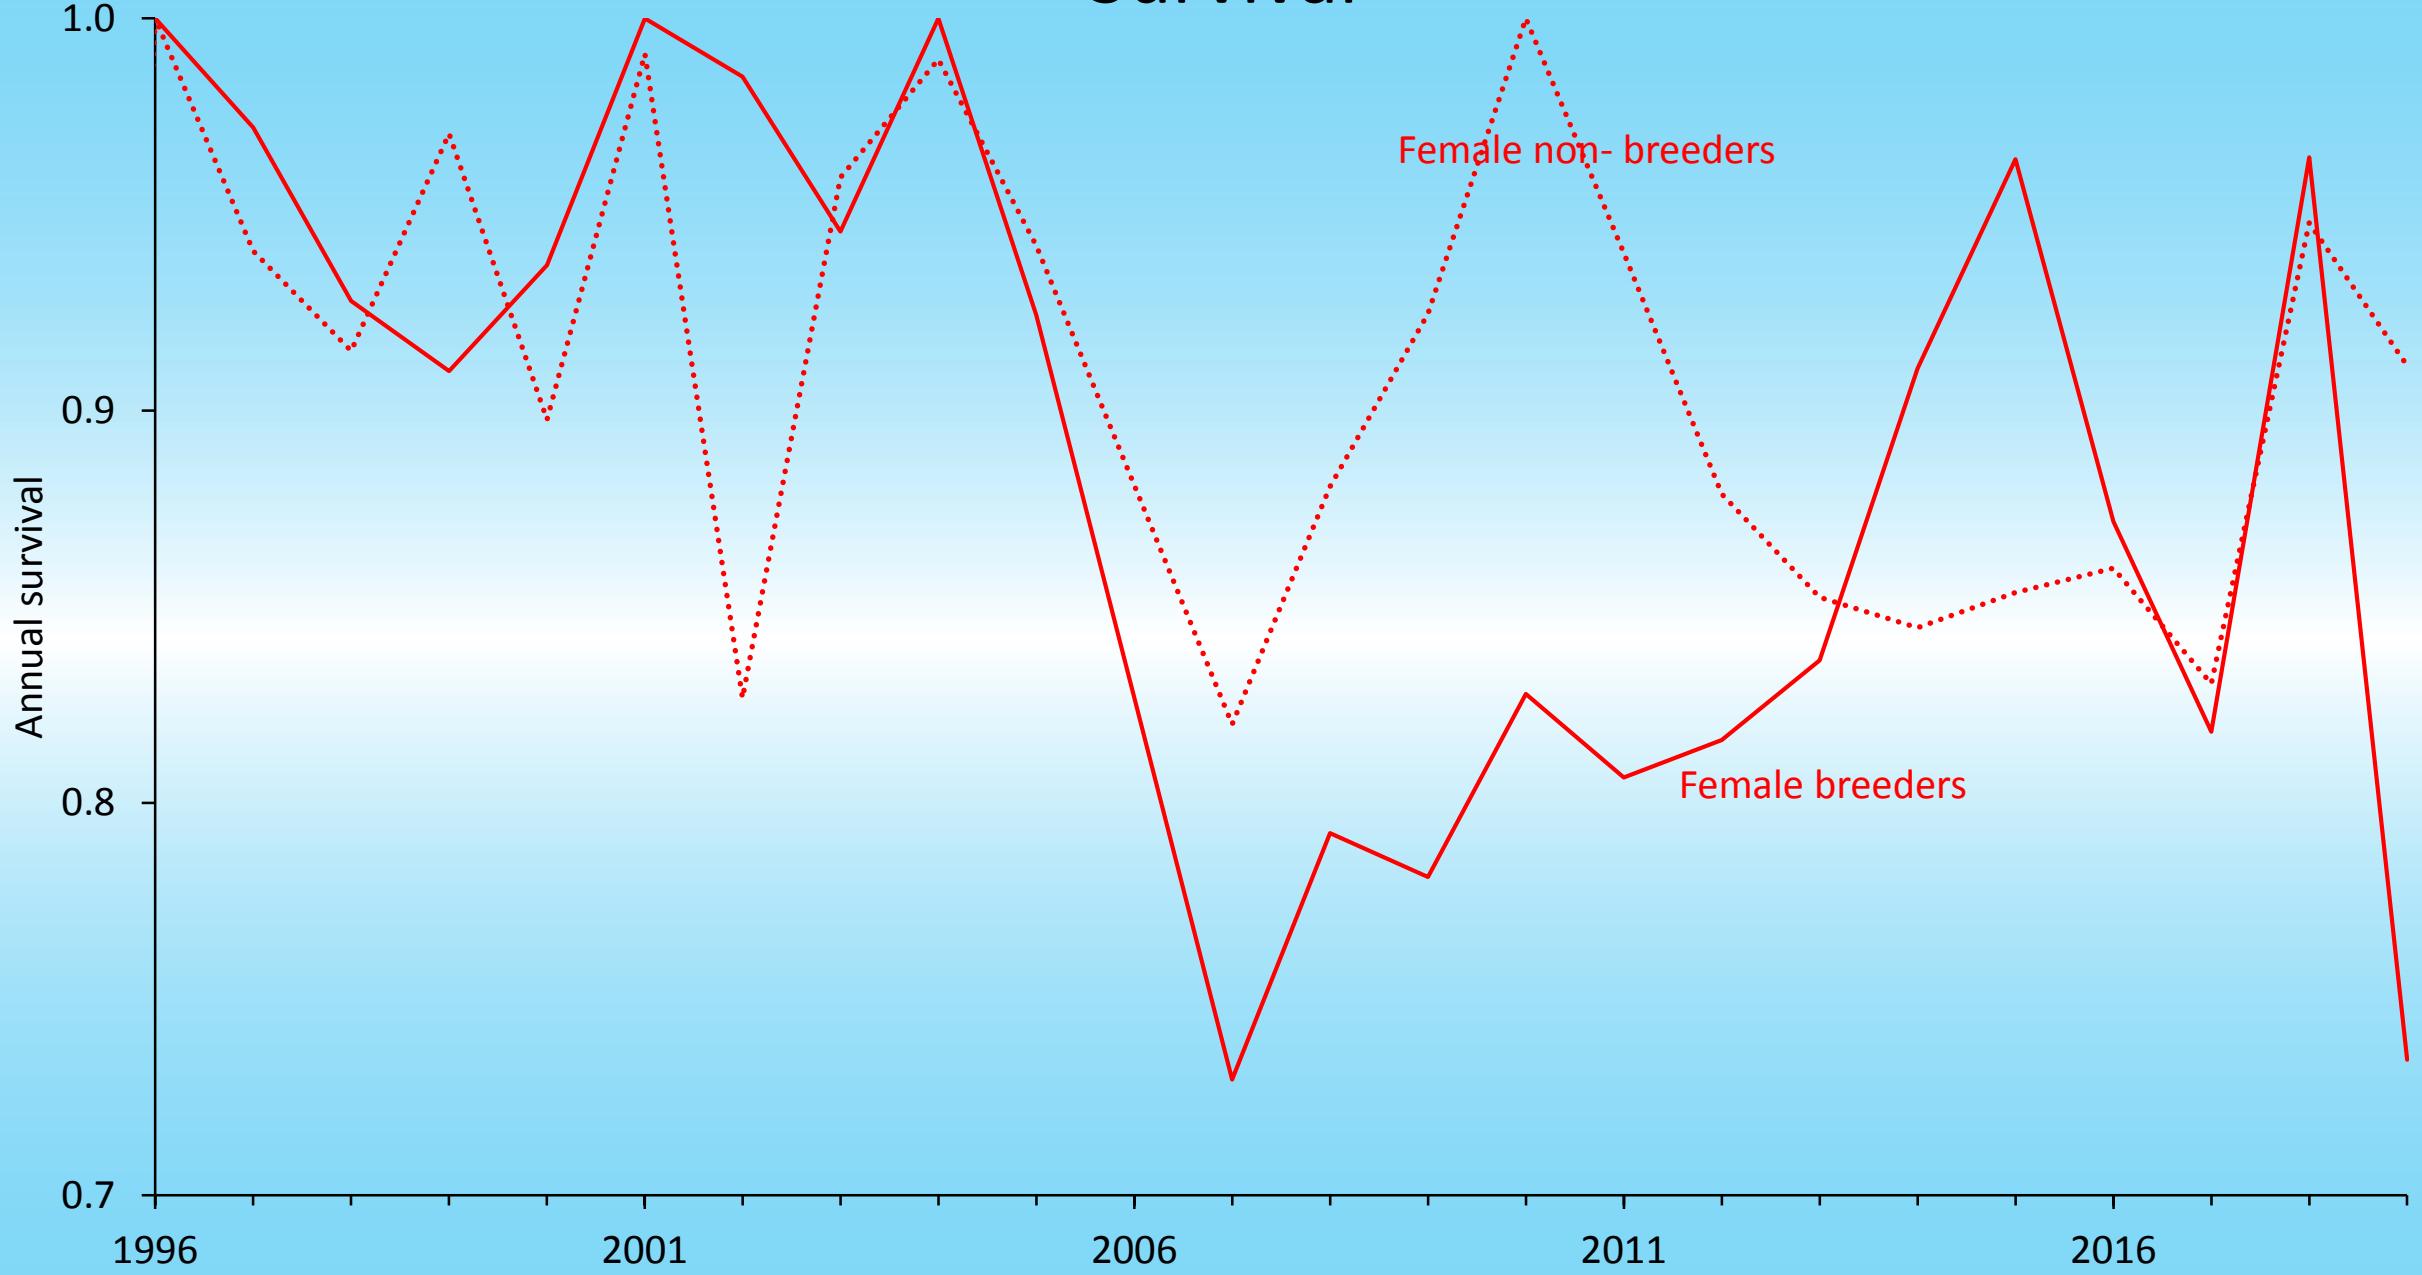

Breeding birds in the study area

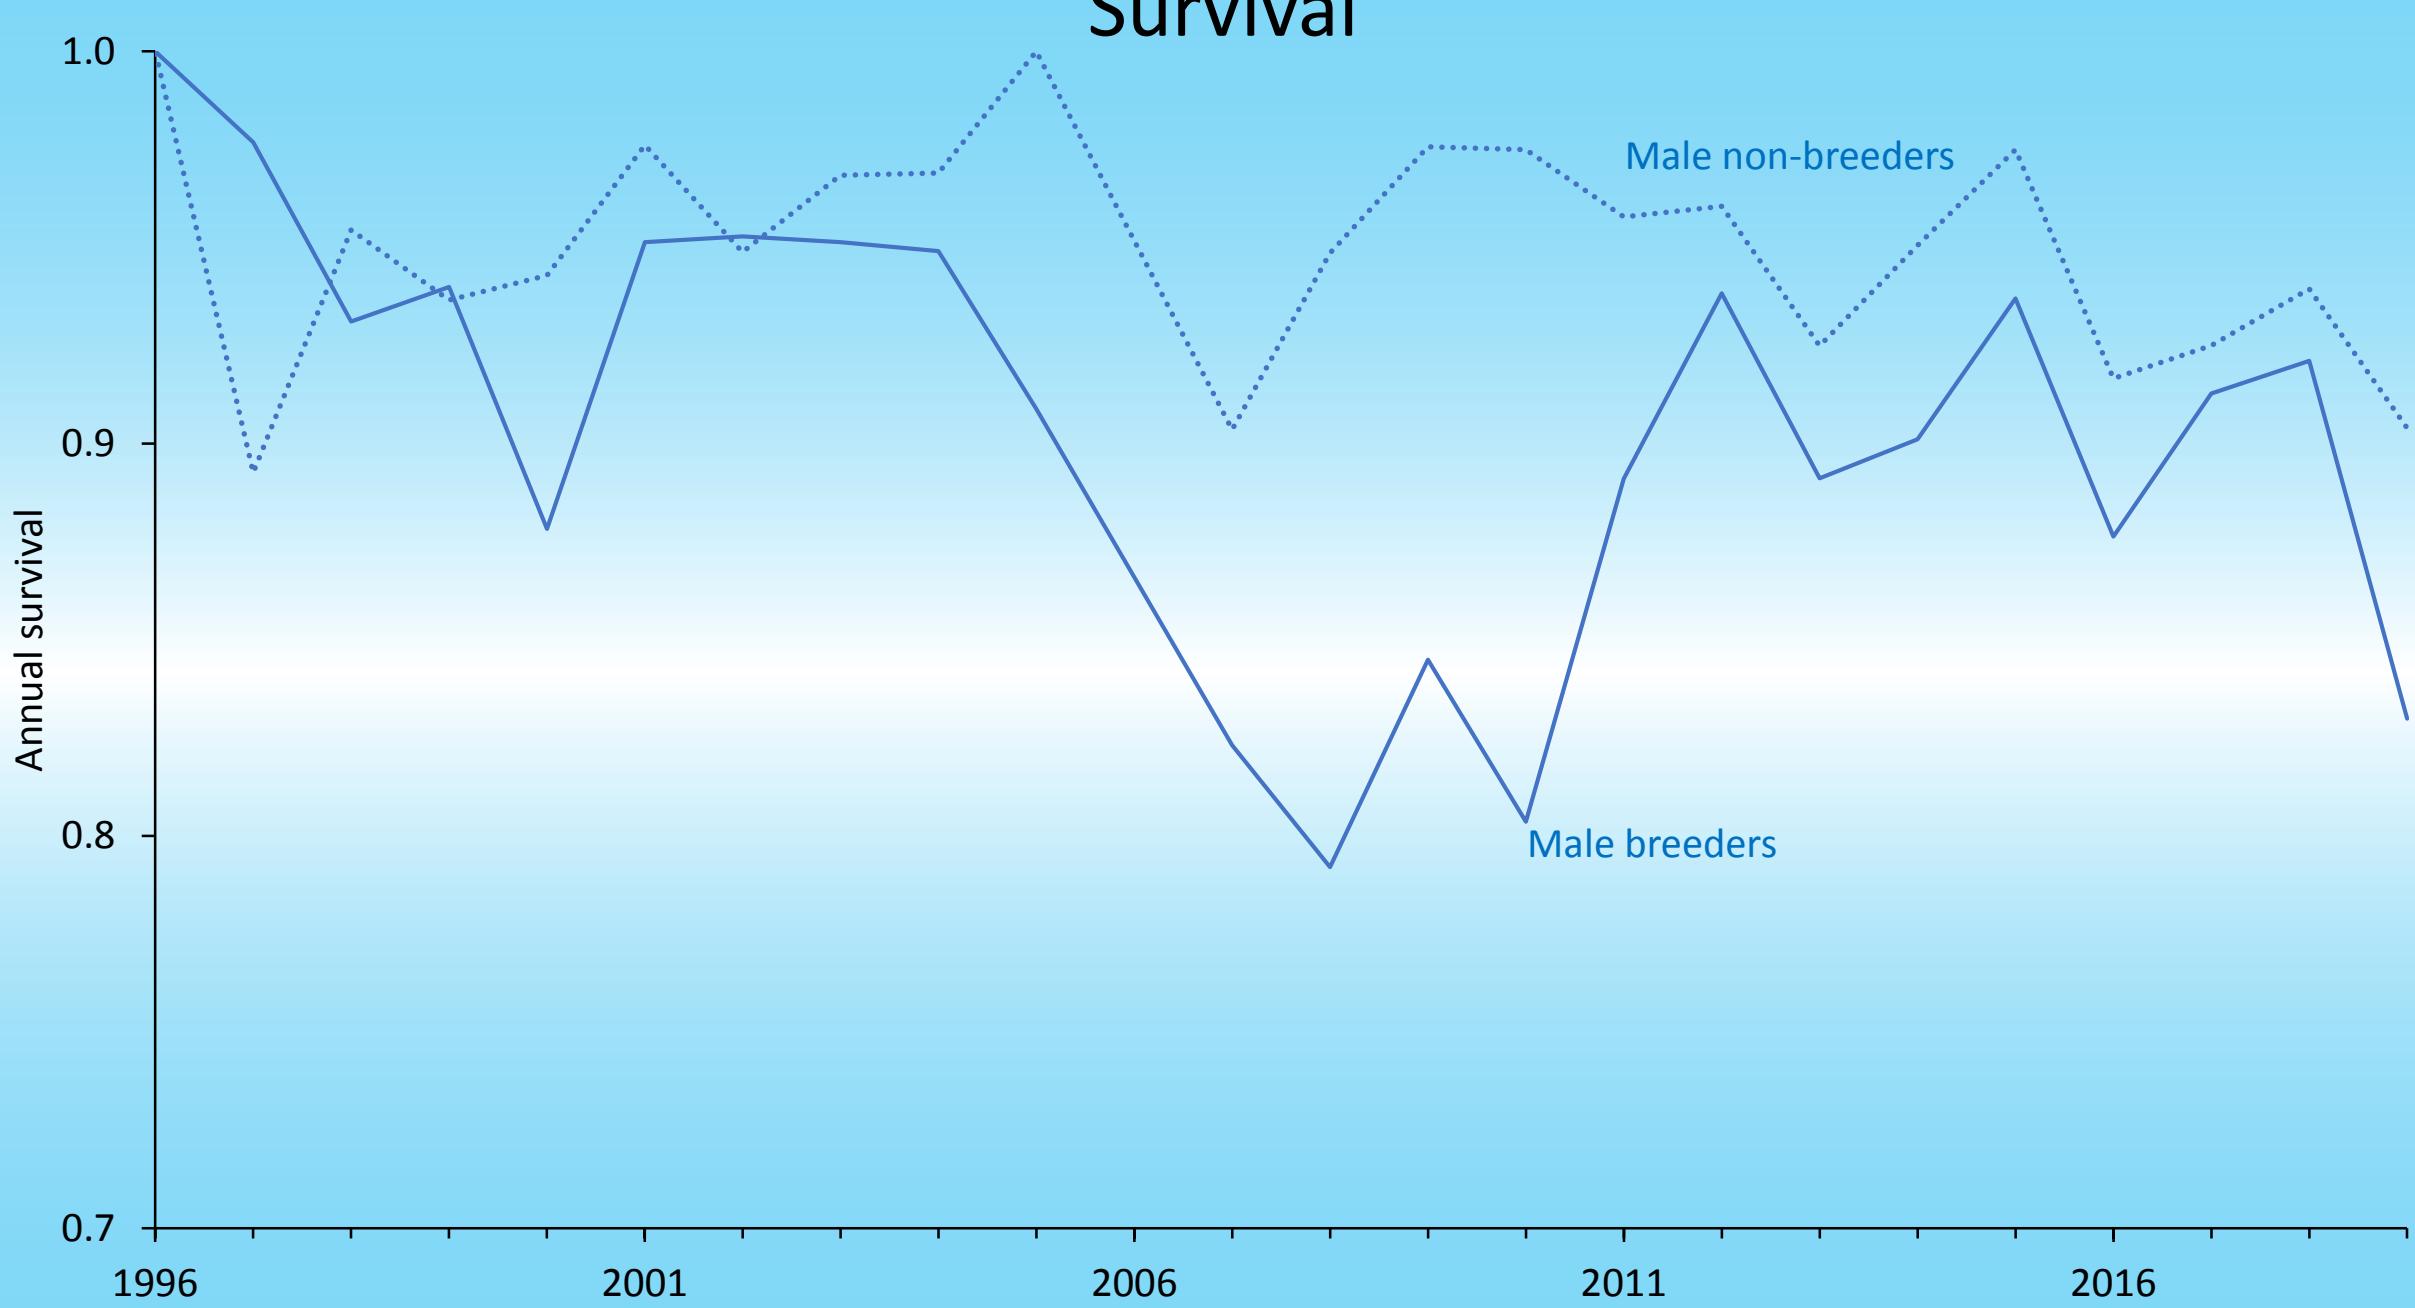

Survival

Survival

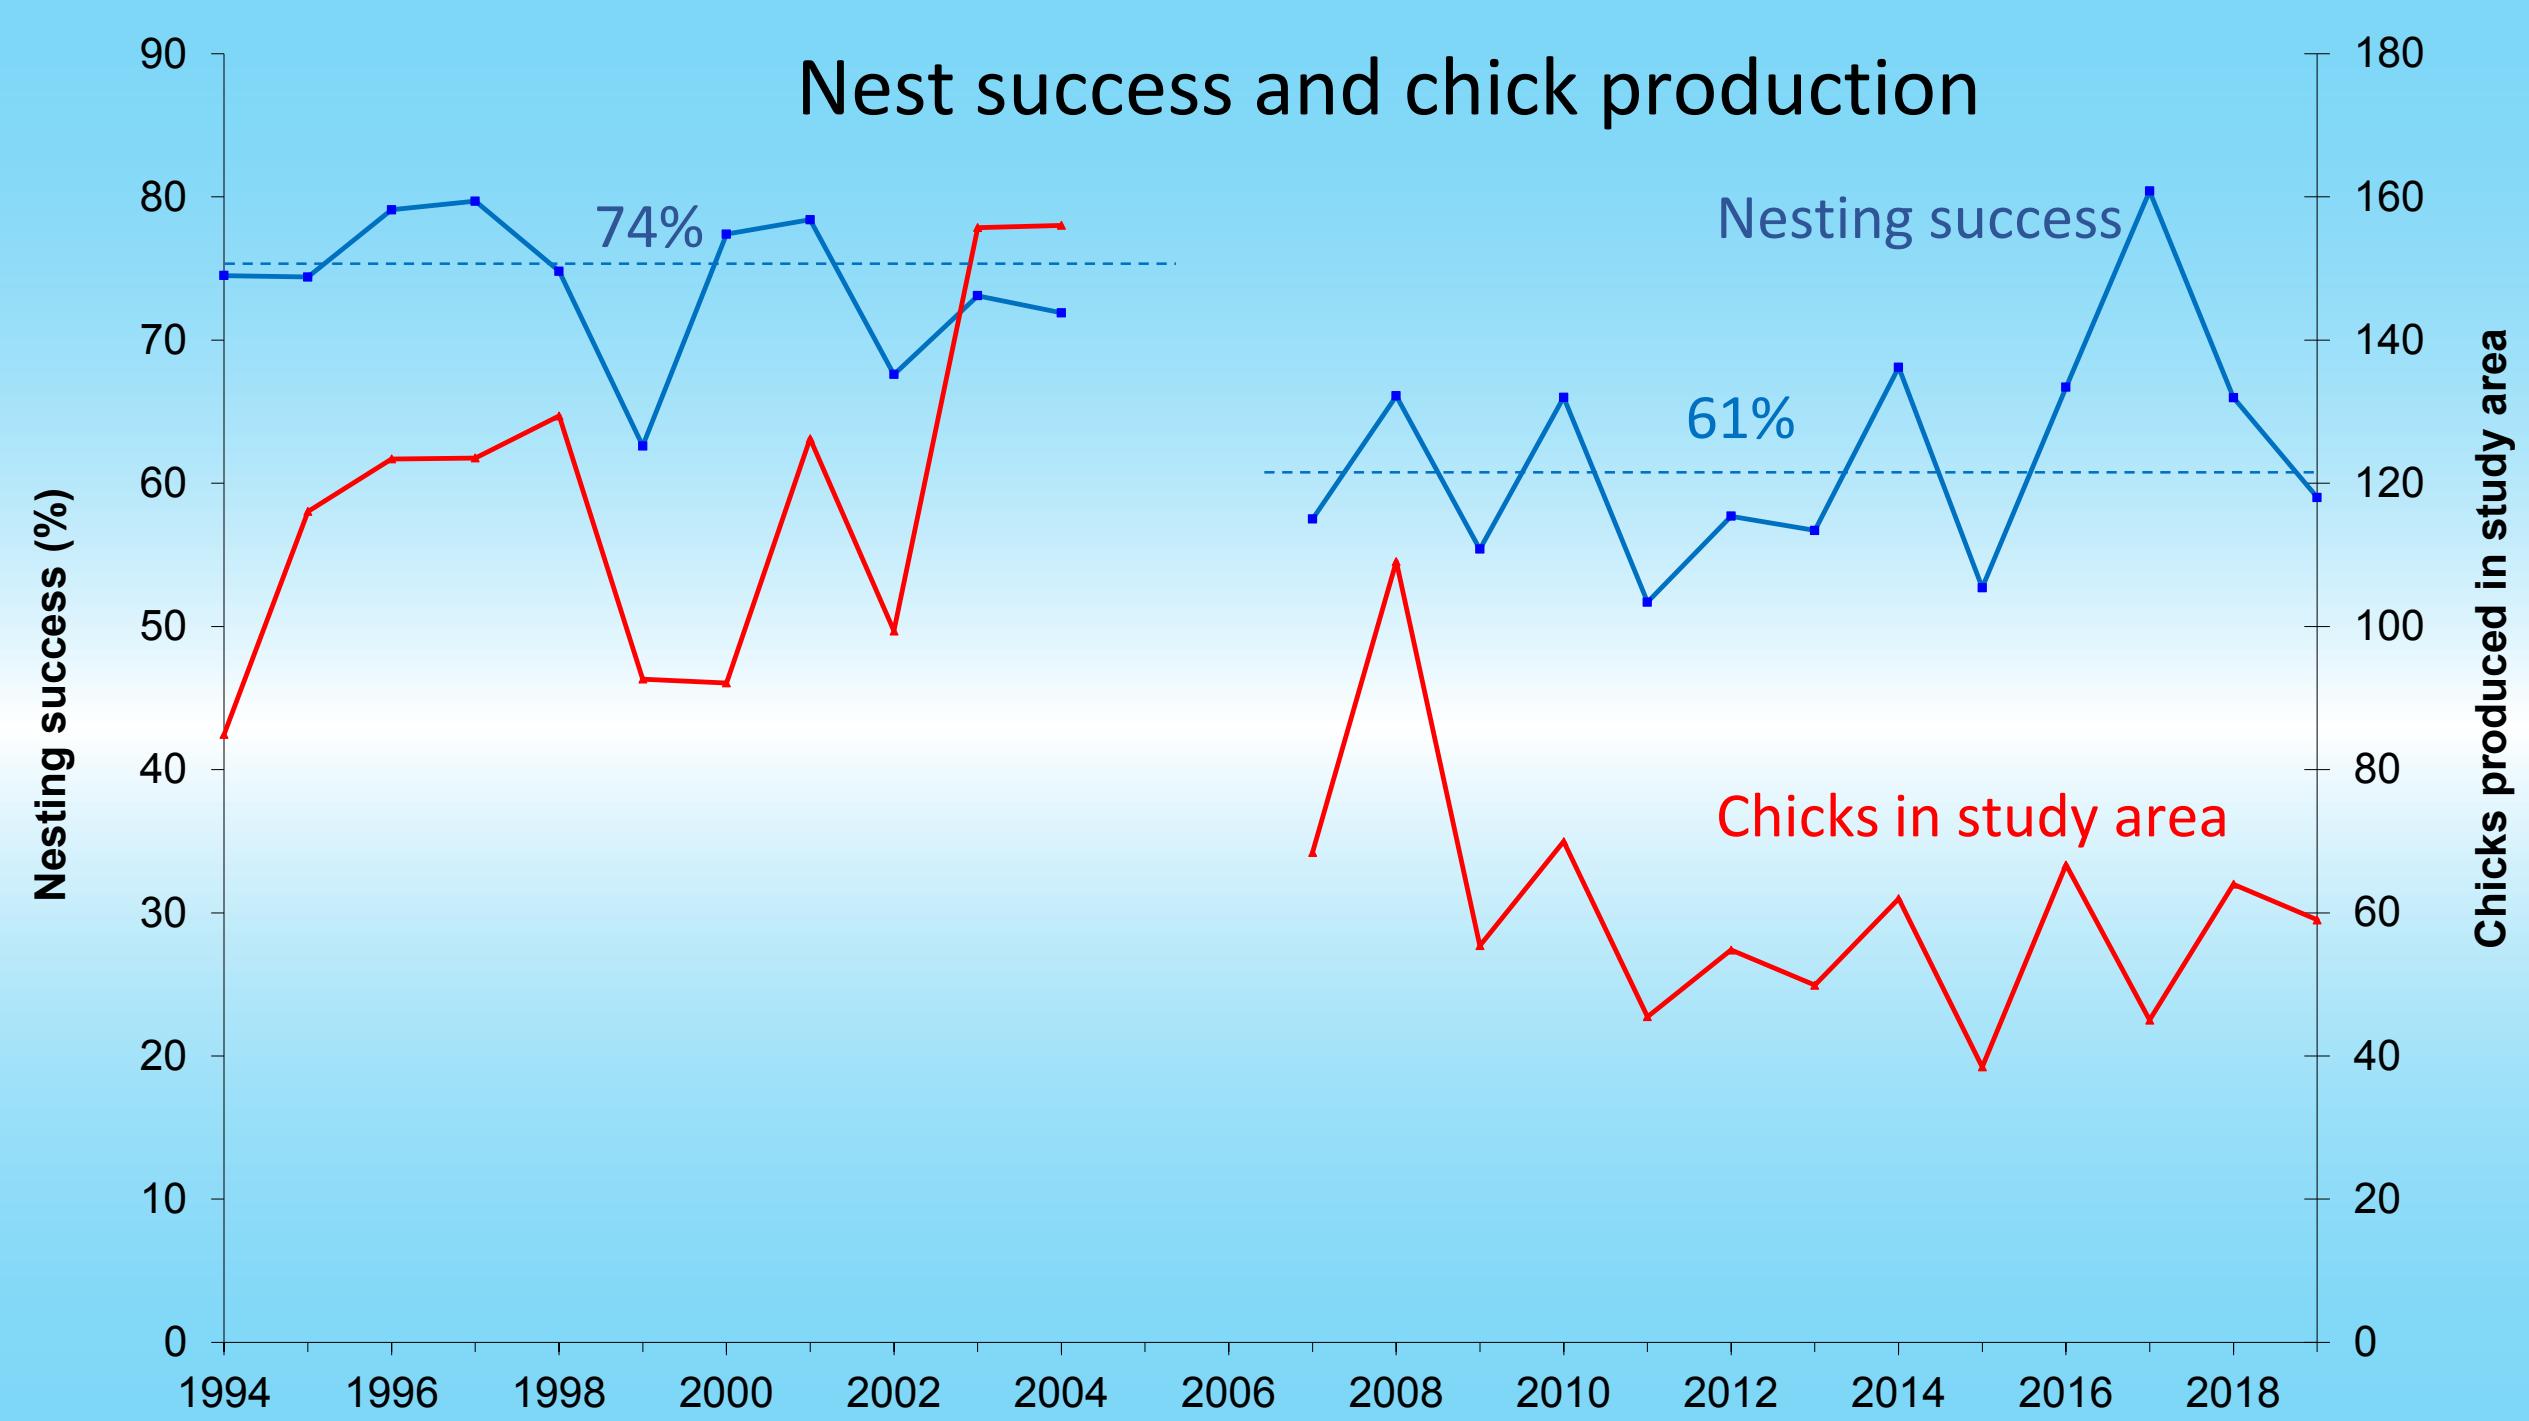

Survival

Recruitment

- Population is doing better than it might because of relatively high recruitment.
- The average age of new birds is 18 years – they hatched before the 2004 decline.
- Since 2004 few chicks produced each year – soon going to run out of new potential recruits.

Nest success and chick production

Last year's transmitters

2019 deployments

	Number of birds	Mean length of transmission (range)	Specs	Weight (g)
Sextant Technology, Xargos	20	62 (0-144)	Solar, gps, doppler shift	90
Lotek, Pinpoint	13	106 (12-242)	Battery, doppler shift	60
Wildlife Computers, Rainier S20	10	249 (76-410)	Solar, gps, doppler shift	30
Telonics, TAV2360	20	301 (108-389)	Battery, doppler shift	45
