# DRAFT

## Executive summary

Many protected coral species occur as bycatch in commercial fisheries around New Zealand. The Conservation Services Programme of the Department of Conservation recognise that Government Fisheries Observers on commercial fishing vessels are not always able to identify this bycatch at sea with high precision (especially to species level), with the confirmation of species requiring identification from a coral taxonomist in many cases.

This report summarises the sample and image identifications of all observed coral bycatch that occurred during the period 1 July 2019 to 31 December 2019. A total of 15 specimen samples were collected and returned for identification during the reporting period. Sub-samples from each live specimen were taken for future genetic studies. Additionally, there were 41 historical samples with revised higher-level identifications made during the reporting period, and these are also reported on.

A total of 145 specimens were identified by digital images during the reporting period; 139 were protected coral taxa, and 122 of these were able to be georeferenced. Additionally, nine specimens were identified by digital images received in April 2017 (for the reporting period 1 July 2016 to 30 June 2017). These historical specimens belonged to the black coral taxa, and five of these were able to be georeferenced.

Data are presented by Fisheries Management Areas (FMA), fishing method, and targeted fishery. Highest protected coral specimen counts came from the Southern Offshore Islands and Sub-Antarctic (FMA6) regions, as well as from two northern FMA's. Most were taken by bottom trawl operations throughout the regions targeting deepsea species orange roughy and smooth oreo.

## Background

The specific objectives for this project are:

1. To determine, through examination of returned protected cold-water coral specimens and images, the taxon, and where possible the provenance of cold-water corals killed in New Zealand fisheries (for returned dead specimens).
2. To collect sub-samples of all protected cold-water coral specimens for genetic analysis in future.
3. To assist with observer training and the development/improvement of observer training resources.

There are several milestones for this project, here we report on Milestone 1. Six monthly progress update with a “Summary of coral specimens identified by samples and images, bycaught during the period 1 July 2019 – 31 December 2019.”

This progress update presents:

1. A summary description of protected coral fauna recently identified from physical specimens and images.
2. Appendix A: Summary output from NIWA Invertebrate Collection (NIC) *Specify* Database *niwainvert*; (a) updated with revised identifications of 17 bycatch specimens (in 15 sample lots) collected between 1 July 2019 to 31 December 2019, and (b) historical bycatch specimens identified from 1 July 2019 to 31 December 2019.

3. Appendix B: (a) Spreadsheet summary of digital images processed and identified for the reporting period 1 July 2019 to 31 December 2019, and (b) Spreadsheet summary of specimens identified from images received in April 2017.

## Description of protected coral fauna

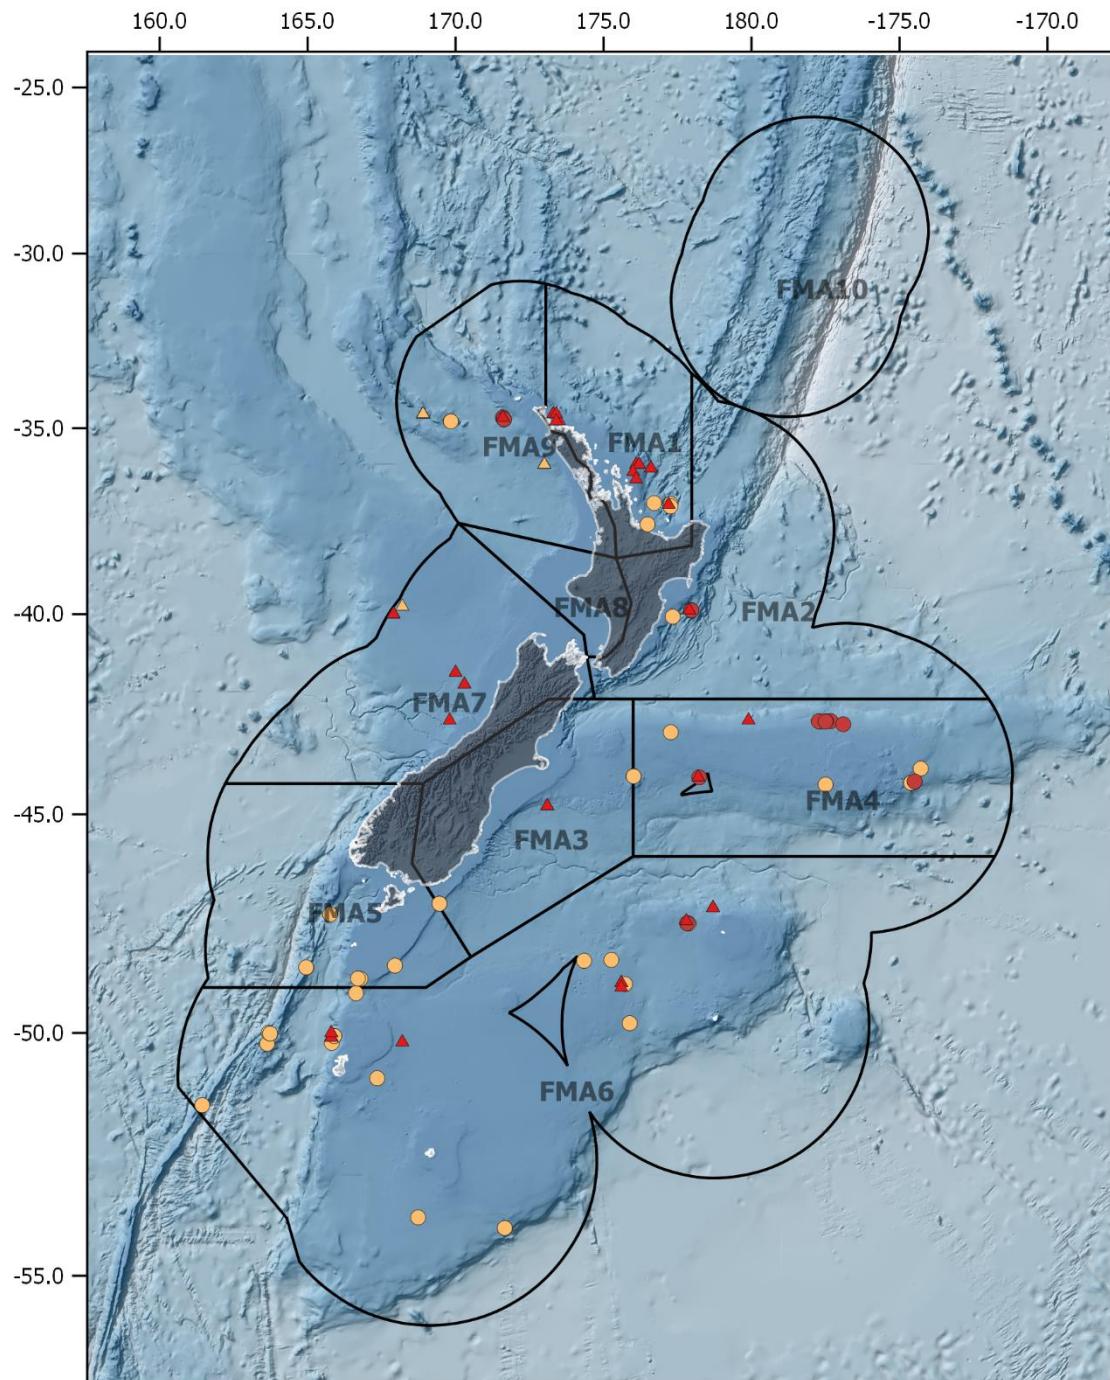

### Physical specimens

During the reporting period 1 July 2019 to 31 December 2019, NIWA received and processed 17 observer collected protected coral specimens in 15 sample lots, which were identified during this reporting period. All physical specimens returned to NIWA were collected by bottom trawl, with 14 specimens from fisheries targeting orange roughy and three specimens from fisheries targeting smooth oreo. Sub-samples from each live specimen were taken for future genetic studies.

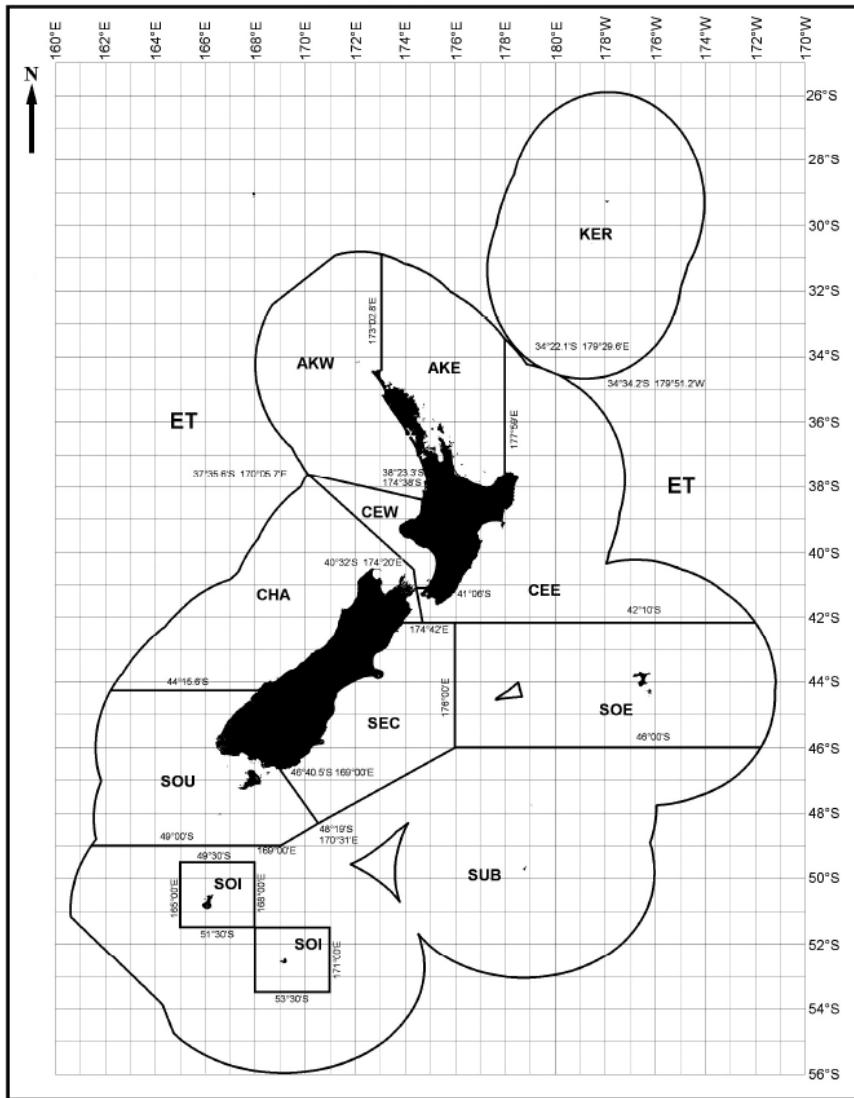

A summary of bycatch specimens collected between 1 July 2019 to 31 December 2019 and identified by experts are provided in the NIWA Invertebrate Collection (NIC) *Specify* Database *niwainvert* extract (Appendix A, part (a)) and presented in Table 1. A summary of 41 historical bycatch specimens identified by experts between 1 July 2019 to 31 December 2019 is also provided (Appendix A, part (b)).

**Table 1.** Summary of protected coral species with a count of number of specimens collected from each Fisheries Management Area (FMA) and target fishery collected 1 July–31 December 2019. Refer to Fig. 2 for FMA location. ORH = orange roughy, SSO = smooth oreo.

| Order                  | Family           | Genus                | Species                        | FMA (target fishery) |           |           |           |           | Total no. of specimens |
|------------------------|------------------|----------------------|--------------------------------|----------------------|-----------|-----------|-----------|-----------|------------------------|
|                        |                  |                      |                                | AKW (ORH)            | CEE (ORH) | SOE (ORH) | SOE (SSO) | SUB (SSO) |                        |

| Total no. of specimens |                  |                      |                                | 7                    | 2         | 5         | 1         | 2         | 17                     |

**Figure 1.** Bycatch coral specimens (red circles) and specimens from images (red triangles) collected 1 July–31 December 2019, and historical coral specimens identified between 1 July–31 December 2019 (orange circles) and historical specimens from images received in April 2017 (orange triangles). Data are plotted by Fisheries Management Area's (FMA) 1-10. See Figure 2 for corresponding Observer FMA codes.

**Figure 2.** Observer Fisheries Management Area (FMA) codes. Taken from the FNZ Observer Manual.

### Specimen Images

During the reporting period 1 July 2019 to 31 December 2019, NIWA received 408 digital images and 163 of these were processed. The remaining 245 were not processed either because they were not of protected coral taxa, or as they were of coral bycatch taken outside of New Zealand's Exclusive Economic Zone (EEZ). This project does not report on High Seas protected coral bycatch.

In total, 145 specimens were identified from the 163 processed images (noting that at times there were multiple images of the same specimen). Of the 145 identified specimens, 139 were protected coral taxa, and 122 of these were able to be georeferenced. All processed images presented here were photographed within New Zealand's EEZ. There were 17 protected coral specimens unable to be georeferenced due to either missing station number or incomplete FNZ photographic logs and 'Benthic Materials' form data, or data entered on new bottom longline forms which are not yet available from COD. The remaining six specimens were determined to be non-protected taxa: rocks

with hydroids, bryozoans and soft corals growing on them, and a large *Antipathella* black coral encrusted with jewel anemones and snake stars (Appendix B, part (a), also see Figure 3).

**Figure 3.** Large black coral *Antipathella* (top left and bottom right) encrusted with a species of *Corynactis* (jewel anemone, top right) and *Astrobrachion constrictum* (snake stars, bottom left) [Observer, FNZ]. These specimens were returned (NIWA 131888 – 131890).

Only 113 of the 163 processed images contained a FNZ label providing trip and tow number information. Tow numbers for a further 37 images were able to be determined by either:

- using COD database and the image timestamp to cross check the trip tow start and tow end date and time details already entered in COD, in the FNZ photographic logs, and on the ‘Benthic Materials’ form, or
- by cross checking the images with specimen records already entered in the Specify database - as some specimens that had been photographed were also sent to NIWA by the Observer and they had a label indicating the tow number.

Data summaries for the specimens identified from images are provided below and include a count by Observer Fisheries Management Areas (FMA) (Table 2, Figure 1), a count of tows and specimens by fishing method and target fishery (Table 3). Table 4 provides a count of specimens identified by species.

**Table 2.** Summary of specimens by Fisheries Management Area (FMA).

| Area         | Description                       | Count of Specimens |
|--------------|-----------------------------------|--------------------|
| AKE          | Auckland East (FMA1)              | 18                 |

Overall a high number of specimen images were taken of coral bycatch from the Southern Offshore Islands and Sub-Antarctic (both FMA6) regions, as well as in the northern FMA's (FMA1 and 9). The highest number of tows with coral bycatch were recorded from bottom trawls targeting orange roughy and smooth oreo. Other fisheries with coral bycatch included vessels targeting black oreo, tarakihi, hoki, and alfonsino. Figure 4 shows bycatch of protected corals taken from the Southern Offshore Islands by bottom trawl.

**Figure 4.** Example of high coral catch rate and specimen count taken during a bottom trawl operation targeting orange roughy, from FMA6, Southern Offshore Islands. Species identified include bamboo coral colonies and live and dead branching stony coral matrix (*Solenosmilia variabilis*) [Observer, FNZ].

A summary of nine specimens identified by digital images received in April 2017 (for the reporting period 1 July 2016 to 30 June 2017) is also provided in Appendix B, part (b). All specimens were black coral taxa and five were able to be georeferenced. Four specimens were collected from Auckland West (FMA9) and one from Challenger (FMA7), all by bottom trawls targeting either orange roughy or alfonsino and long-finned beryx.

The effort of Observers working at-sea to collect specimens and/or specimen images is mostly carried out to a very high standard. Identifications would be made easier however if observers returned either the whole specimen or a sub-sample of the specimen or coral colony, and if labelling protocols were routinely followed.

### Acknowledgements

Our thanks to the FNZ observers for their efforts at sea and to the various coral experts who provided identifications for this reporting period. These included Rob Stewart and Peter Marriott (NIWA), Marcelo Kitahara (Universidade de São Paulo, Brazil), and Stephen Cairns (Smithsonian Institution, USA). We acknowledge the NIC team for providing on-going curatorial support for the specimens. Finally, our thanks to Aiden Liu (NIWA) for COD data extracts.

## Appendices

### Appendix A: Summary output from NIWA Invertebrate Collection (NIC) Specify Database *niwainvert*

(a) updated with revised identifications of 17 bycatch specimens (in 15 sample lots) collected between 1 July 2019 to 31 December 2019
